

Description

[A Liquid Solution mixture designed to aid in the visual location of trace amounts of game animal blood.]

DETAILED DESCRIPTION

[0001] This invention is a Liquid Solution mixture. This Liquid Solution is comprised of Hydrogen Peroxide at a 4% by Volume mixture. This 4% by Volume solution is produced by mixing a proportionate amount of Conditioned Water to a Hydrogen Peroxide Catalyst of 34%. This quantitative 4% by Volume Liquid Solution is the required mixture to insure the desired results for its intended use. A Liquid Solution that is readily atomized in a typical "Spray Bottle" format.

[0002] Once in this format it is sprayed in an area known or assumed to have blood from a wounded game animal. In such events there are situations that seeing small trace amounts of game animal blood are misread. And in some instances overlooked completely, simply because of the

size of the spot or because of the similarity of color in this natural setting. The above invention is designed to aid in the visual location of these trace amounts of game animal blood.
